Result

Pred. No. is the score greater the and is derived be

is the number of results predicted by chance to have a ster than or equal to the score of the result being printed, rived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The specification describes polypeptides encoded by the Rht gene (and Cits homologues) that, when expressed in Triticum Aestivum, inhibit growth of the plant. This growth inhibition is antagonised by Cg gibberellin. The products can be used to provide Rht expression in CG plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be CC used to produce Rht mutant plants which are dwarfed compared with CC wild type, the dwarfing being gibberellin-insensitive. Taller plants CC may be made by knocking out Rht or the relevant homologous gene in CC compounds which inhibit gibberellin biosynthesis, such as paclobutrazol, CC e.g. to allow use of a gibberellin biosynthesis, such as paclobutrazol CC compounds which inhibit gibberellin biosynthesis inhibitor to keep weeds CC dwarf but let crop plants grow tall. The present sequence is encoded by the wheat Rht clone 5al genomic sequence.

This growth inhibition is antagonised by gibberellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin-insensitive. Taller plants may be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin biosynthesis, such as paclobutrazol, e.g. to allow use of a gibberellin biosynthesis inhibitor to keep weeds the major last grow tall. The present sequence is encoded by the major last grow tall.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      antagonist; gibberellin; dwarf phenotype; gibberellin biosynthesis; paclobutrazol; maize.

The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Triticum Aestivum, inhibit growth of the plant. This growth inhibition is antagonised by gibberellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin-insensitive. Taller plants

Plants may be made which are resistant to compounds which inhibit gibberellin biosynthesis, such as paclobutrazol, e.g. to allow use of a gibberellin biosynthesis inhibitor to keep weeds dwarf but let crop plants grow tall. The present sequence is encoded by the wheat Rht clone C15-1 cDNA sequence.

                                                                                                                                                                                                                                                                                                                                                                                            respiration, starch and sucrose synthesis and degradation, pathogen response, wounding response, cell cycle regulation, pigmentation, flowering and senescence of plants and for modifying sink-source relationships in seeds, tubers, roots, and other storage organs leading to an increase in yield. The transcription factor polynucleotides and polypeptides may be used to alter the structure and developmental characteristics of plants such as soybean, wheat, corn, potato, cotton, rice, oliseed, sunflower, alfalfa, sugarcane, turf, banana, blackberry, blueberry, strawberry, raspberry, cantaloupe, carrot, cauliflower, coffee, cucumber, eggplant, grapes, honey dew, lettuce, mango, melon, onion, papaya, peas, peppers, pineapple, spinach, squash, sweet corn, tobacco, tomato, watermelon, rosaceous fruits and/or vegetable brassicas. The present sequence is a homolog of Arabidopsis thaliana transcription factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 factors which may be used to modify phenotype associated with a plant's sugar sensing characteristics and increasing yield when their expression level is altered. Sugars are central regulatory molecules that control aspects of physiology, metabolism and development. Therefore the cDNAs and proteins of the invention are useful for modifying the growth and germination rates of plants, photosynthesis, glyoxylate metabolism,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Jiang

The transcription factor is used for altering a plant's cC biochemical characteristics. The transcription factor may be used to CC alter the structure and developmental characteristics of plants such as CC soybean, wheat, corn, potato, cotton, rice, oilseed rape, sunflower, CC alfalfa, sugár cane, turf, banana, blackberry, blueberry, strawberry, cc raspberry, cantaloupe, carrot, cauliflower, coffee, cucumber, eggplant, CC grapes, honey dew, lettuce, mango, melon, onion, papaya, peas, peppers, CC pineapple, spinach, squash, sweet corn, tobacco, tomato, watermelon, crosaceous fruits and/or vegetable brassicas. Transcription factors are key controlling elements of biological pathways and altering expression clevels of 1 or more transcription factors can change entire biological pathways in an organism. Therefore manipulating transcription factor CC levels in plants offers great potential in agricultural biotechnology for modifying a plant's traits. Transcription factor CDNA is useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                        produce tall or dwarf plants, particularly the latter for increased resistance to lodging and increased yield. It may also allow regulation of flowering, i.e. plants remain in the vegetative state until treated with GA, useful to inhibit bolting in spinach and lettuce. GAI can be used to raise specific antibodies for identifying homologous proteins or genes in other species. gai fragments can also be used as probes or primers to identify and clone related sequences, or in the preparation of antisense or sense expression regulating (co-suppressing) sequences. Rice plants that express GAI may be resistant to Bakane disease. Manipulation of gai and GAI makes it possible to tailor the degree of dwarfism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gibberellin insensitivity; gai; plant growth inhibition; dwarf phenotype; lodging resistance; increased yield; flowering regulation; bolting inhibition; spinach; lettuce; antibody; identification; probe; primer; antisense; sense; expression regulation; co-suppression; rice; Bakane disease resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is the Arabidopsis thaliana gibberellin insensitivity (gai) gene product (GAI), the expression of which insensitivity (gai) gene product (GAI), the expression of which inhibits plant growth. However the inhibition is antagonised by gibberellin (GA), while gai expression confers a dwarf phenotypy gibberellin (GA), while gai expression confers a dwarf phenotypy that is insensitive to GA. Manipulating gai and GAI expression or that is insensitive to GA. Manipulating gai and GAI expression or that is insensitive to GA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid encoding gibberellin inhibitor GAI and related antisense sequences - used to create tall, or particularly, plants, especially crops such as maize, rice and wheat

factors which may be used to modify phenotype associated with a plant's consumer sensing characteristics and increasing yield when their expression level is altered. Sugars are central regulatory molecules that control aspects of physiology, metabolism and development. Therefore the cDNAs and proteins of the invention are useful for modifying the growth and comparition, starch and sucrose synthesis, glyoxylate metabolism, response, wounding response, cell cycle regulation, pigmentation, corresponse, wounding response, cell cycle regulation, pigmentation, corresponse, wounding response, cell cycle regulation, pigmentation, corresponse, and senescence of plants and for modifying sink-source correlationships in seeds, tubers, roots, and other storage organs leading to an increase in yield. The transcription factor polynucleotides and polypeptides may be used to alter the structure and developmental correction, oilseed, sunflower, alfalfa, sugarcane, turf, banana, blackberry, conffee, cucumber, eggplant, grapes, honey dew, lettuce, mango, melon, melon,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Key

Transcription factors are key controlling elements of biological pathways and altering expression levels of 1 or more transcription factors can change entire biological pathways in an organism. Therefore manipulating transcription factor levels in plants offers great potential in agricultural biotechnology for modifying a plant's traits. Transcription factor cDNA is a controlled to the controlled
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     17-NOV-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Š
                                                               The present sequence is given in a specification relating to the CC structure and function of a regulatory gene, SCARECROW (SCR).

CC SCARECROW-like (SCL) genes encoding proteins containing an amino acid CC sequence similar to the sequence of MOTIF III (VHIID) of Arabidopsis SCR protein are disclosed. SCR and SCL genes are useful for producing CC transgenic plants whose cell division is modified and root and/or stem CC development and gravitropism of stem or hypocotyl is altered. Cell CC division is increased or decreased in roots resulting in thicker or CC thinner root development. The transgenic plants are useful for expressing CC a gene of interest encoding a gene product that confers herbicide, salt, CC pathogen or insect resistance in root or embryos and genes encoding CC confers less susceptibility to lodging in the transgenic plants than a CC wild-type plant. SCR gene sequences are also useful as molecular markers CC for a quantitative trait e.g. root or gravitropism trait in molecular for property of the property of the content of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Scarecrow gene useful for producing transgenic plants expressing genes whose product increases starch, lignin or cellulose biosynthesis and confers herbicide, pathogen or insect resistance -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAB28575 standard; Protein; 531

The mutant GRAS protein is used to produce dwarf plants, specifically crucifers. Dwarf plants may be sown earlier (increasing nitrate accumulation without risking excessive stem growth during winter), and have better resistance to cold and lodging. They are also easier to harvest and allow for better

The specification describes a mutant allele of the BZH gene, which contains a G1695A mutation resulting in the mutation E546K in the protein. GRAS proteins are transcription factors implicated in regulation of the response to gibberellins and thus in control of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents a mutant plant protein of the GRAS family. The mutant allele of the BZH gene contains a G1695A mutation resulting in the mutation E546K in the protein GRAS proteins are transcription factors implicated in regulation of the response to glibberellins and thus in control of morphogenesis and plant development. The mutant GRAS protein is used to produce dwarf plants, specifically crucifers. Dwarf plants may be sown earlier (increasing nitrate accumulation without risking excessive stem growth during winter), and have better resistance to cold and lodging. They are also easier to harvest and allow for better monitoring of the crop.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Scarecrow gene; SCR gene; plant; regulatory gene; SCARECROW-like; transgenic plant; cell division; molecular marker; herbicide resistant resistance; pathogen resistance; insect resistance.
The present sequence is given in a specification relating to the structure and function of a regulatory gene, SCARECROW (SCR). SCARECROW-like (SCI) genes encoding proteins containing an amino acid sequence similar to the sequence of MOTIF III (VHIID) of Arabidopsis: protein are disclosed. SCR and SCL genes are useful for producing transgenic plants whose cell division is modified and root and/or stendevelopment and gravitropism of stem or hypocotyl is altered. Cell
                                                                                                                                                                                                                                                                  Scarecrow gene useful for producing transgenic plants expressing whose product increases starch, lignin or cellulose biosynthesis confers herbicide, pathogen or insect resistance -

The transgenic plants are useful for expressing a gene of interest encoding a gene product that confers herbicide, salt, pathogen or insect resistance in root or embryos and genes encoding starch, lighin or cellulose biosynthesis in shoots. The SCR gene also confers less susceptibility to lodging in the transgenic plants than a wild-type plant. SCR gene sequences are also useful as molecular markers for a quantitative trait e.g. root or gravitropism trait in molecular

   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                    1594
